

DatePicker for LiveCode

by www.FlexibleLearning.com

How do I update my copy of DatePicker?

If you already have DatePicker, you need to replace the old files.

Backup first...

1. Create a new empty folder on the desktop and name it appropriately with your current version and build number for reference.
2. Locate your old DatePicker files. You will find them in your documents Plugins folder for LiveCode unless you customized your Plugins location:

Windows: My documents/My LiveCode/Plugins
Mac OS X: Documents/My LiveCode/Plugins

3. Copy all the old DatePicker files from 'My LiveCode/Plugins' to the new folder.

Now transfer the new files...

4. Locate the DatePicker update file you downloaded and unzip it. Open the resulting folder and move the files to the 'My LiveCode/Plugins' folder.
5. Re-start LiveCode.

Finally replace embedded copies...

6. If you have any stacks that include an embedded copy of DatePicker, you should consider replacing the old copy with the new one. This will ensure not only that new features are available, but also that everything continues to work as expected especially the Utility that may inadvertently 'start using' the older version and complain or misbehave.
